

SurgiScan

DOCUMENT INTELLIGENCE FOR HEALTHCARE.

GET YOUR EVENINGS BACK.

Turn your filing cabinet into a searchable patient database — for less than the cost of one locum shift.

You see 30 patients a day. Their notes live in three places — the paper file on your desk, the script pad, a sticky note from reception. At 7pm you're still typing, still hunting for that one diagnosis, still copying ICD-10 codes off a list so medical-aid claims don't bounce. Somewhere in the back room, ten years of patient files sit in cabinets nobody can search.

We fix the back room first. Scan your old patient files. Our AI extracts the diagnoses, medications, dates, and patient identifiers. Your staff approves in 30 seconds. The structured record lands in a searchable database — ready when a 2014 patient walks back in, when SARS asks, when the medical aid disputes a claim from three years ago.

Two pains every SA private GP shares

1. A back room full of paper files nobody can search.
2. No view of your practice — which chronic patients are at risk, which medical aids are paying slowest, where revenue is leaking.

Proof, from a real practice we're working with:

200,000 pages of legacy files	R2.33 per page (vs R5 rack rate)	53% lower than market price
---	---	---------------------------------------

A two-doctor practice opened in 2010 had ~20,000 patient files at ~10 pages each. Standard digitisation quotes ran to R400,000 — a project bill no practice signs. We priced as a monthly subscription: 1,500 pages a month at a founder rate that works out to R2.33 a page. They pay R3,500/month, predictable, no project sticker shock. The archive becomes searchable structured data, month by month.

HOW IT WORKS IN YOUR PRACTICE

1	You scan and upload Use your existing scanner. Upload through the secure web portal — no IT installation, no consultant, runs in your browser.
2	AI reads and structures Patient names, dates, ICD-10 diagnoses, NAPPI medications, vitals, allergies — extracted automatically. 65 common SA-GP abbreviations pre-mapped (URTI → J06.9, HTN → I10, T2DM → E11.9).
3	Your staff validates (30 sec) Your receptionist or admin reviews the AI's output and clicks Approve. They know your handwriting; the AI handles 90%, they catch the last 10%. ~30-60 seconds per document.
4	Clean records, searchable Validated patient data lands in a searchable database. Find any patient or document in seconds. Export to your existing EHR via CSV or FHIR — included, no extra charge.

What you don't have to change

- ✓ Keep your paper consult notes. We digitise what you already do.
- ✓ Keep your existing EHR if you have one — we ingest from any system via API, CSV, or FHIR.
- ✓ Keep your workflow. We're a layer that adds capability, not a system that replaces one that works.

Built for the audit, not just the workflow. Every approval, every reversal, every correction is logged. POPIA-aligned, HPCSA-ready, cryptographically signed. If an inspector or medical aid asks, you can show every clinical action on a patient from the day they registered.

From **R3,500** per month

Founder pricing, locked for 12 months. Available until 31 August 2026.

Month-to-month. No setup fees. Cancel anytime with 30 days' notice.
